

Introduction to Apera Forge

Simulation and Training
for Bin Picking and De-Racking

Derek Burrows

Sr. Product Manager

Neil Goossen

Engineering Manager
Technical Lead for Forge

Agenda

1. Apera Forge Overview
2. Creating a simple cell in Forge
3. Diagnosing and solving problems with Forge
4. Sending a Forge cell for training
5. What's New in Forge?
6. Live Q&A

POLL #1

Journey

About Apera AI

- Founded in 2016 by vision industry veterans
- Based in Vancouver, Canada, with sales and support teams across N.A. and Europe
- Hundreds of cameras deployed, including at all top 6 automotive OEMs
- Compatible with all major robotics brands:

FANUC

ABB

Kawasaki
Robotics

DENSO

YASKAWA

STÄUBLI

EPSON

OMRON

JAKA

KUKA

MITSUBISHI ELECTRIC
AUTOMATION, INC.

DOOSAN

Application expertise

Bin Picking

Racking & Deracking

Robotic Guidance

De-palletizing

Assembly

Apera overview

Apera 4D Vision system hardware

Use any off-the-shelf or custom EOAT (end-of-arm tool)

Universal robot compatibility

VuePorts

Off-the-shelf 12MP+ stereo cameras capture detailed imagery

Apera Vue PC

Vision controller captures and processes images, and sends poses & pathing to robot

Apera's approach to VGR: simulate, train, operate

Apera Forge

Simulate

Simulate your cell, testing pickability. Then, send your cell for training.

Train

Neural networks are trained on your cell, generating ready-to-use vision code for your parts

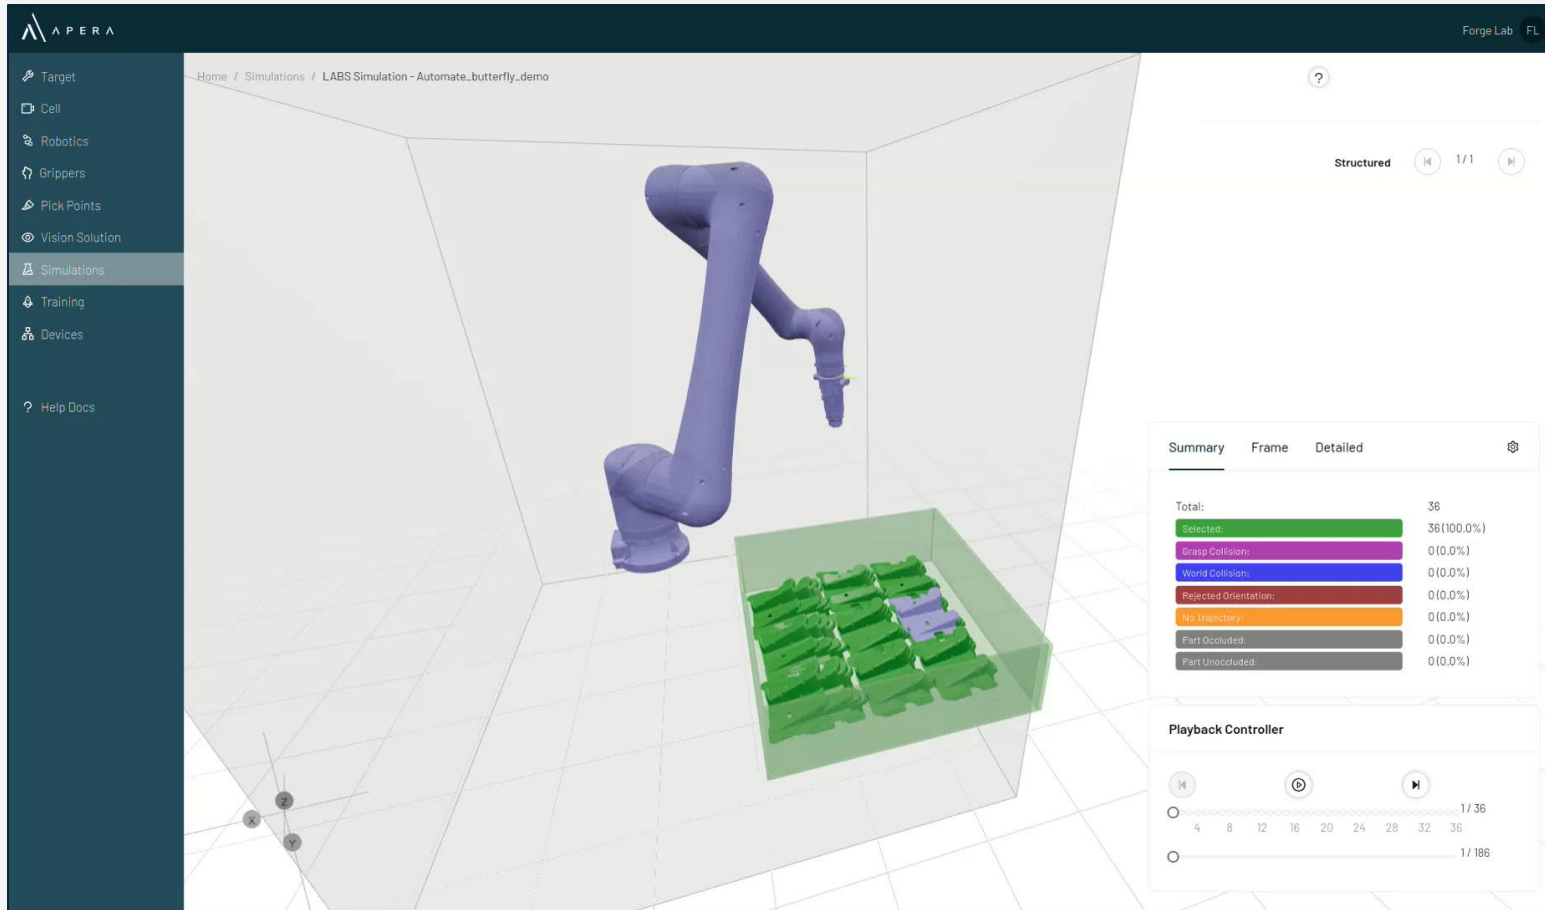

Apera Vue

Operate

Deploy your trained neural network in the field, for industry-leading performance

Apera Forge: VGR simulation and training

Product highlights:

- **Browser-based app** – no need for hardware or site access.
- Wide **library of robots** to choose from
- **Simulate a cell** in minutes, and watch each pick
- **Diagnose issues** with part-by-part pickability scoring

How Forge works

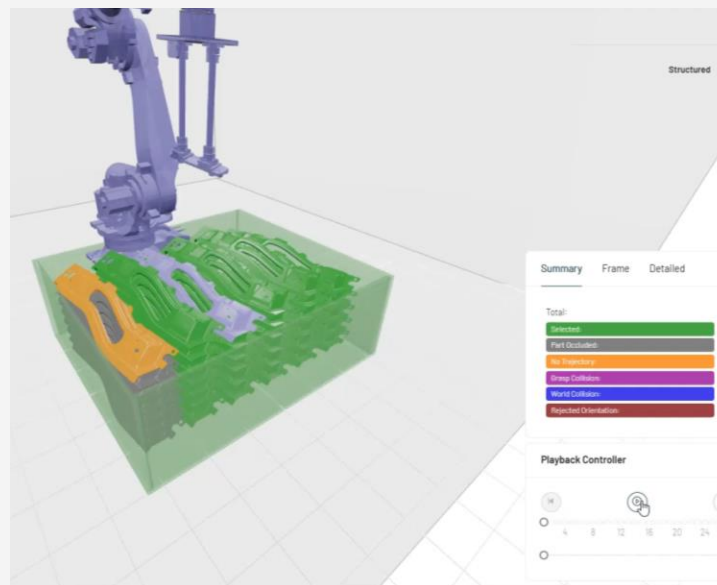

1

Set-up your cell: select a robot, upload your parts and EOATs, and place cameras and obstacles.

2

Simulate, evaluate pickability, and **modify** your design to improve performance.

3

Send data for **training** with one click – and 24-48h later, deploy to your Vue PC.

Why simulate your cell?

When it comes to emptying your bin, geometry matters.

Cell layout

Reaching every corner and edge of your bin requires careful layout of robot, bin, fences, and obstacles.

Gripper design

End-of-arm-tool (EOAT) design must allow you to pick parts, even deep in the bin, without collisions

Pick point selection

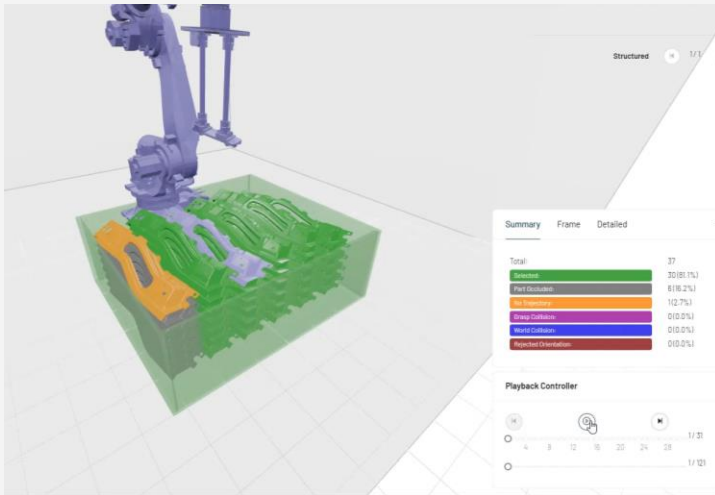

Parts need to be pickable from every angle, at multiple rotations, to effectively empty bins

A lack of cell simulation leads to costly re-work and delays

Case study

Example: catching a design issue

Forge **simulates** cell, robot, custom gripper, bin and structured parts

During simulation, parts in left-most column are found to be **unpickable**

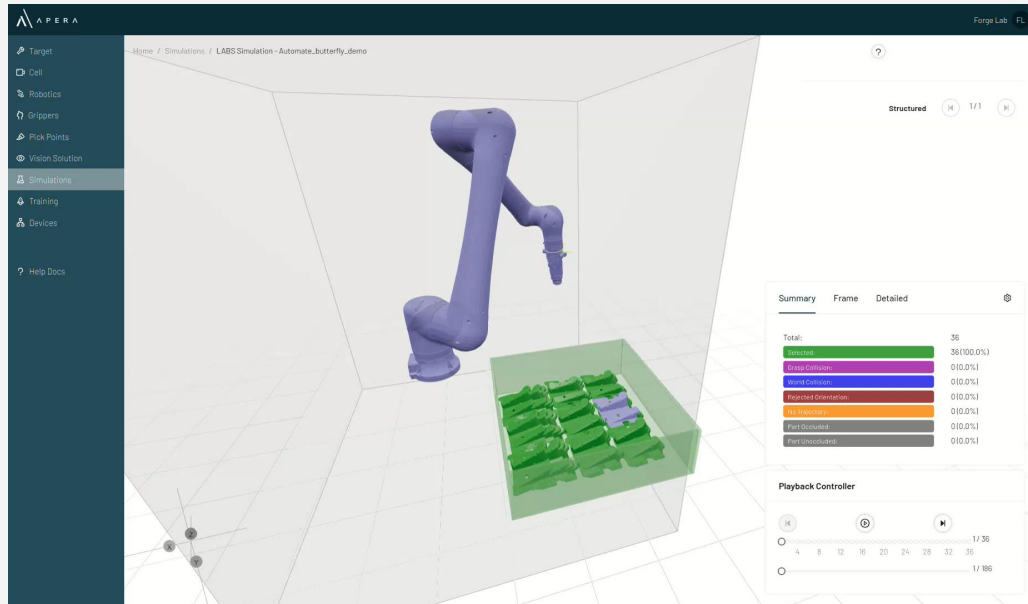

Investigation reveals the robot geometry **incompatible** with the desired gripper angle.

Time to redesign
the gripper or
reposition the bin!

From sim-to-real: training AI assets with Forge

Train an asset in Forge...

And run that trained model on-site.

Forge-trained asset advantages

Accurate

Apera vision systems reach 99.9% reliability in recognizing objects and performing tasks.

Fast

Total vision cycle time as low as 0.3 seconds—delivers up to 10X the speed for up to 2,000 picks /hour.

Light resilient

Works in all lighting conditions—bright, dark, outside, variable—without special equipment.

Difficult materials

Works with all finishes—shiny, clear, translucent—and even difficult bin materials.

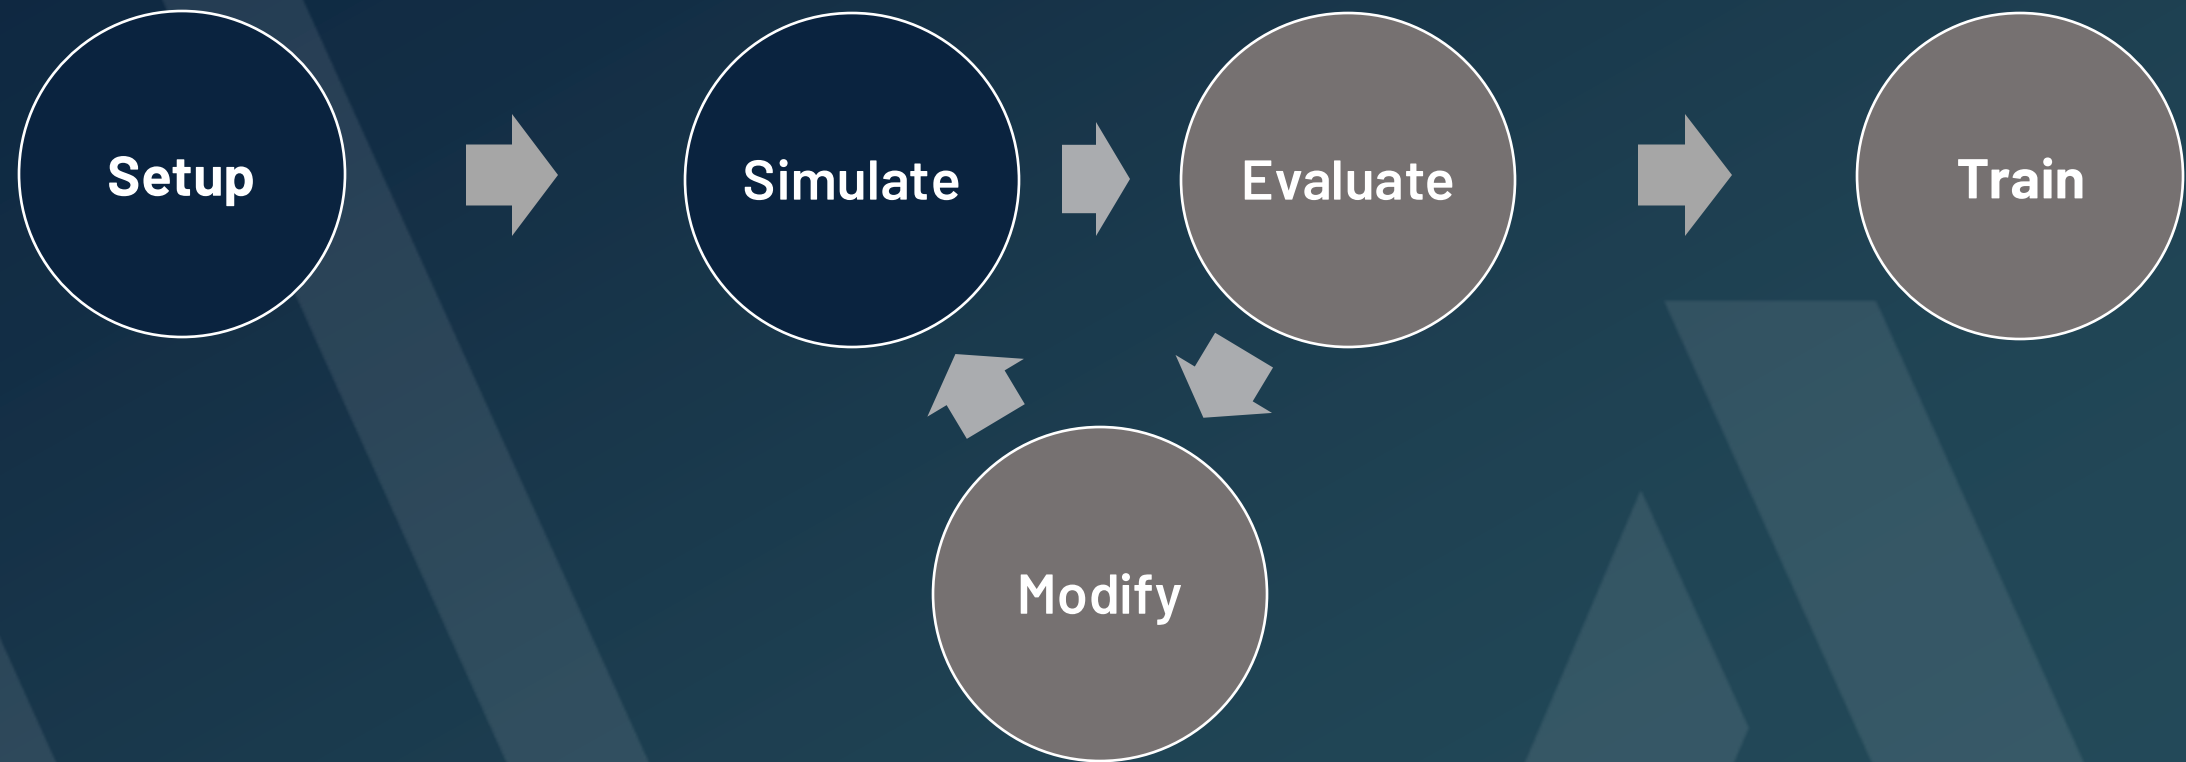

No vision expertise

Forge trains an AI neural network through a million cycles, delivering a plant-ready vision program.

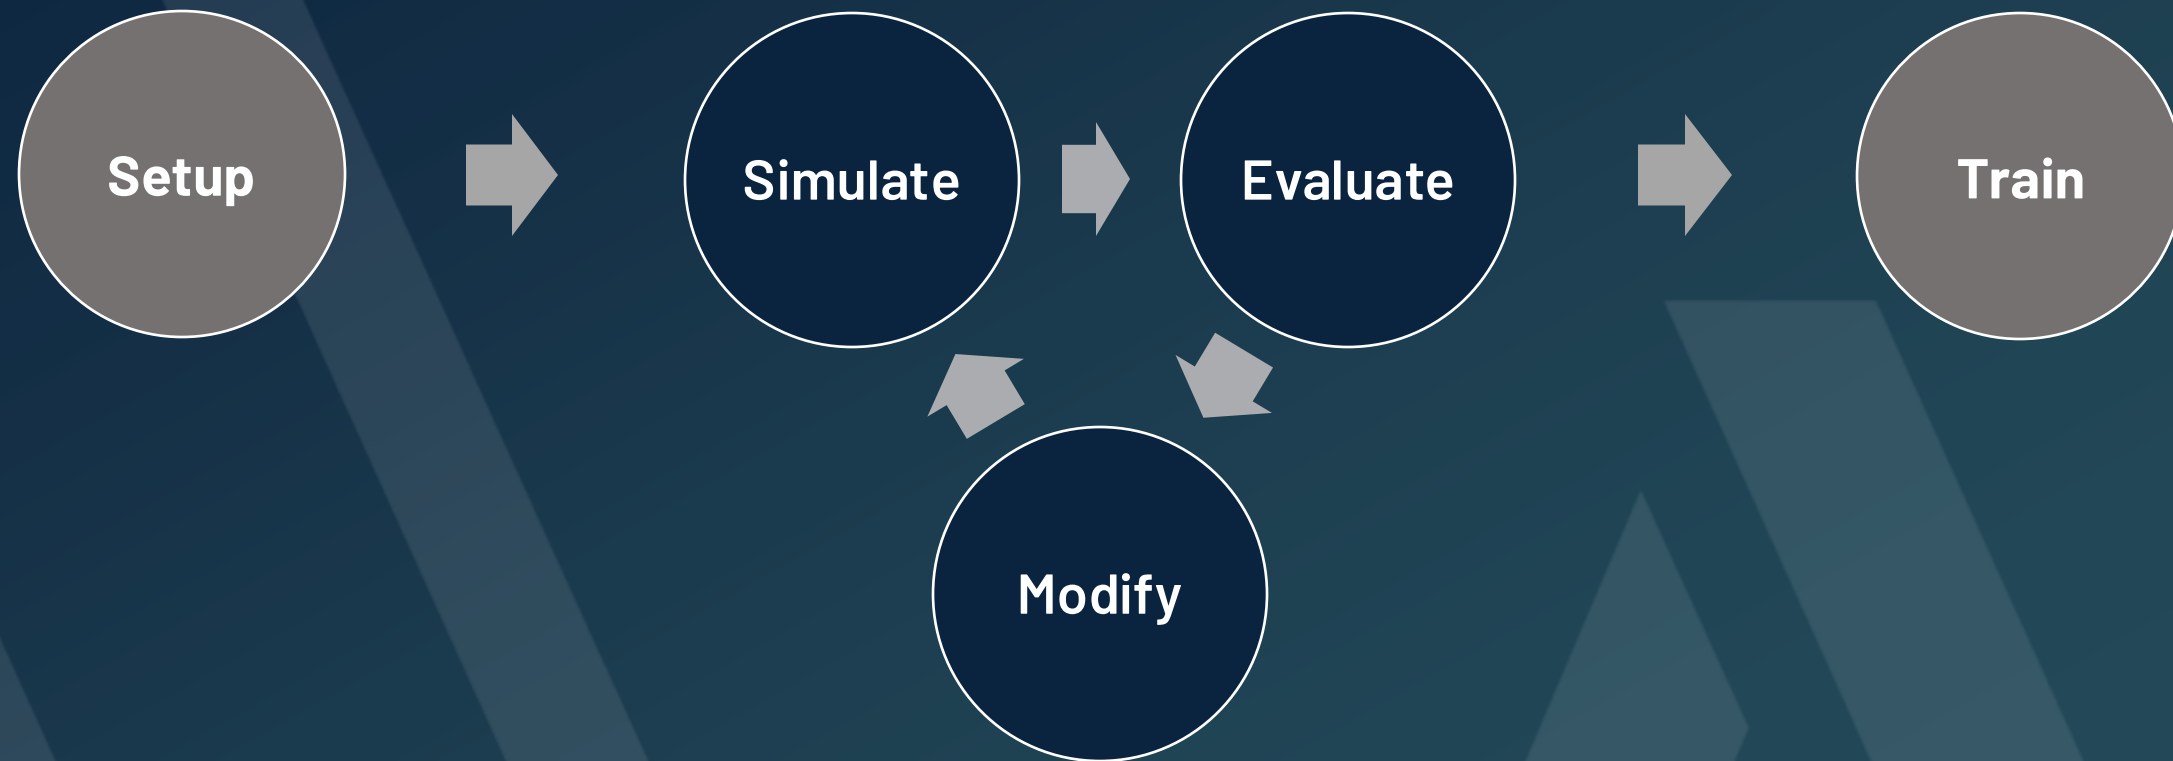

"We've had zero vision faults since the Apera 4D Vision system has been active. We are extremely impressed with Apera's performance, and it has exceeded our expectations."—OEM

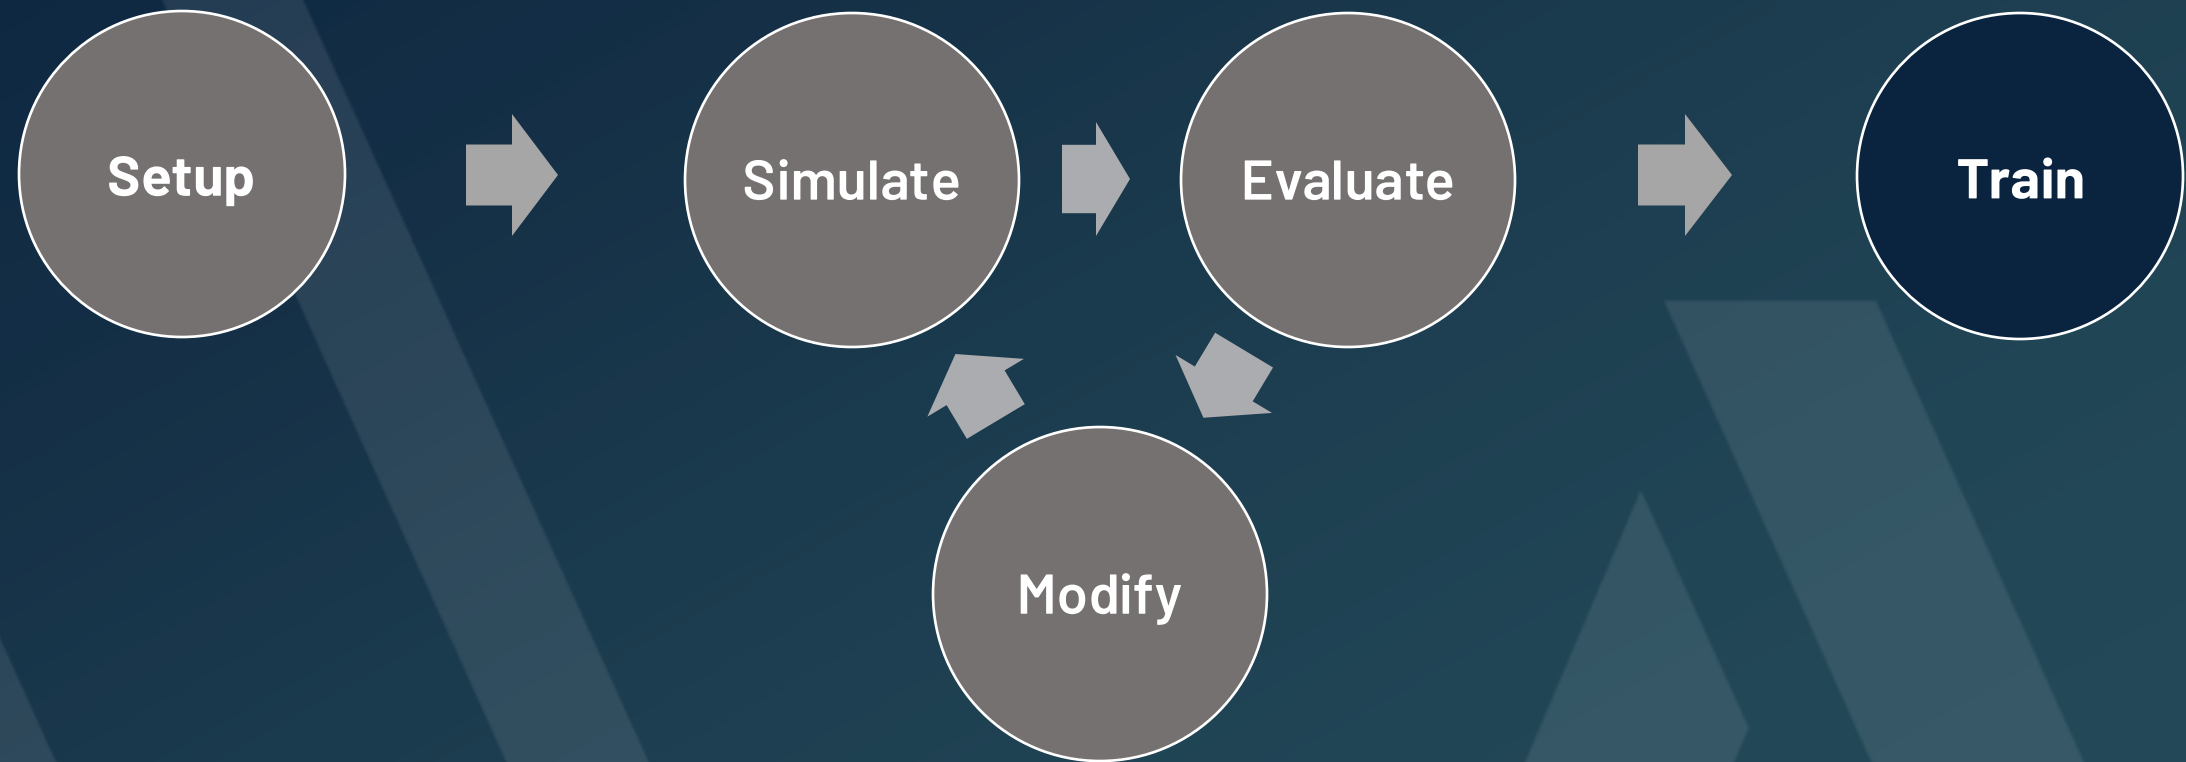

Creating a simple cell demo

Troubleshooting design demo

Training assets demo (bin picking and de-racking)

Recap: why use Forge?

**Validate your cell
layout**

**Test multiple
EOAT designs**

**Understand
pickability**

**Start training on
your schedule**

JULY 2025 – THE DE-RACKING RELEASE

What's new in Forge?

Advanced robotic cell design

New tools for tuning camera placement, bin & rack position, and multi-obstacle placement

EOAT camera mounting

Design and validate eye-in-hand setups, and test L and R cameras, for de-racking applications.

Train de-racking cells

You can now define structured de-racking cells and send them for training on your schedule.
